

Characterization and identification of women with angina pectoris

D. R. Holdright and K. M. Fox

On page 514 of the above article, the third sentence of the second paragraph under the heading *Exercise testing*, should read:

'Similarly, Guiteras *et al.*^[64] found the predictive value of a positive exercise test was 83% in women with typical angina, falling to 50% in women with probable angina—in other words, no better than tossing a coin.'

European Heart Journal (1995) (Supplement O), 85–88

The β_1 -adrenoceptor as antigen: functional aspects

G. Wallukat, A. Kayser and A. Wollenberger

The correct Fig. 1 for the above article is given as shown below.

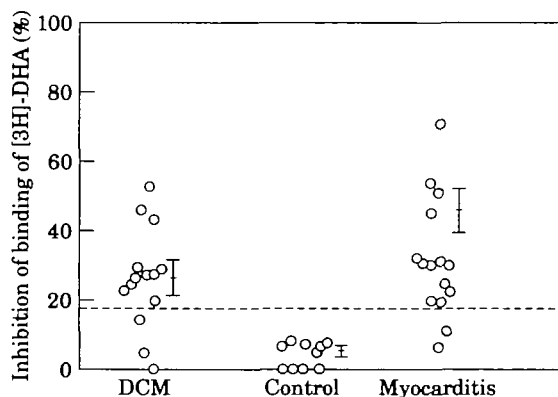

Figure 1 Inhibition of the binding of [³H]dihydroalprenolol to a crude membrane preparation of the pig heart by cardiomyopathic and myocarditic immunoglobulins. Fraction diluted 1:100.
